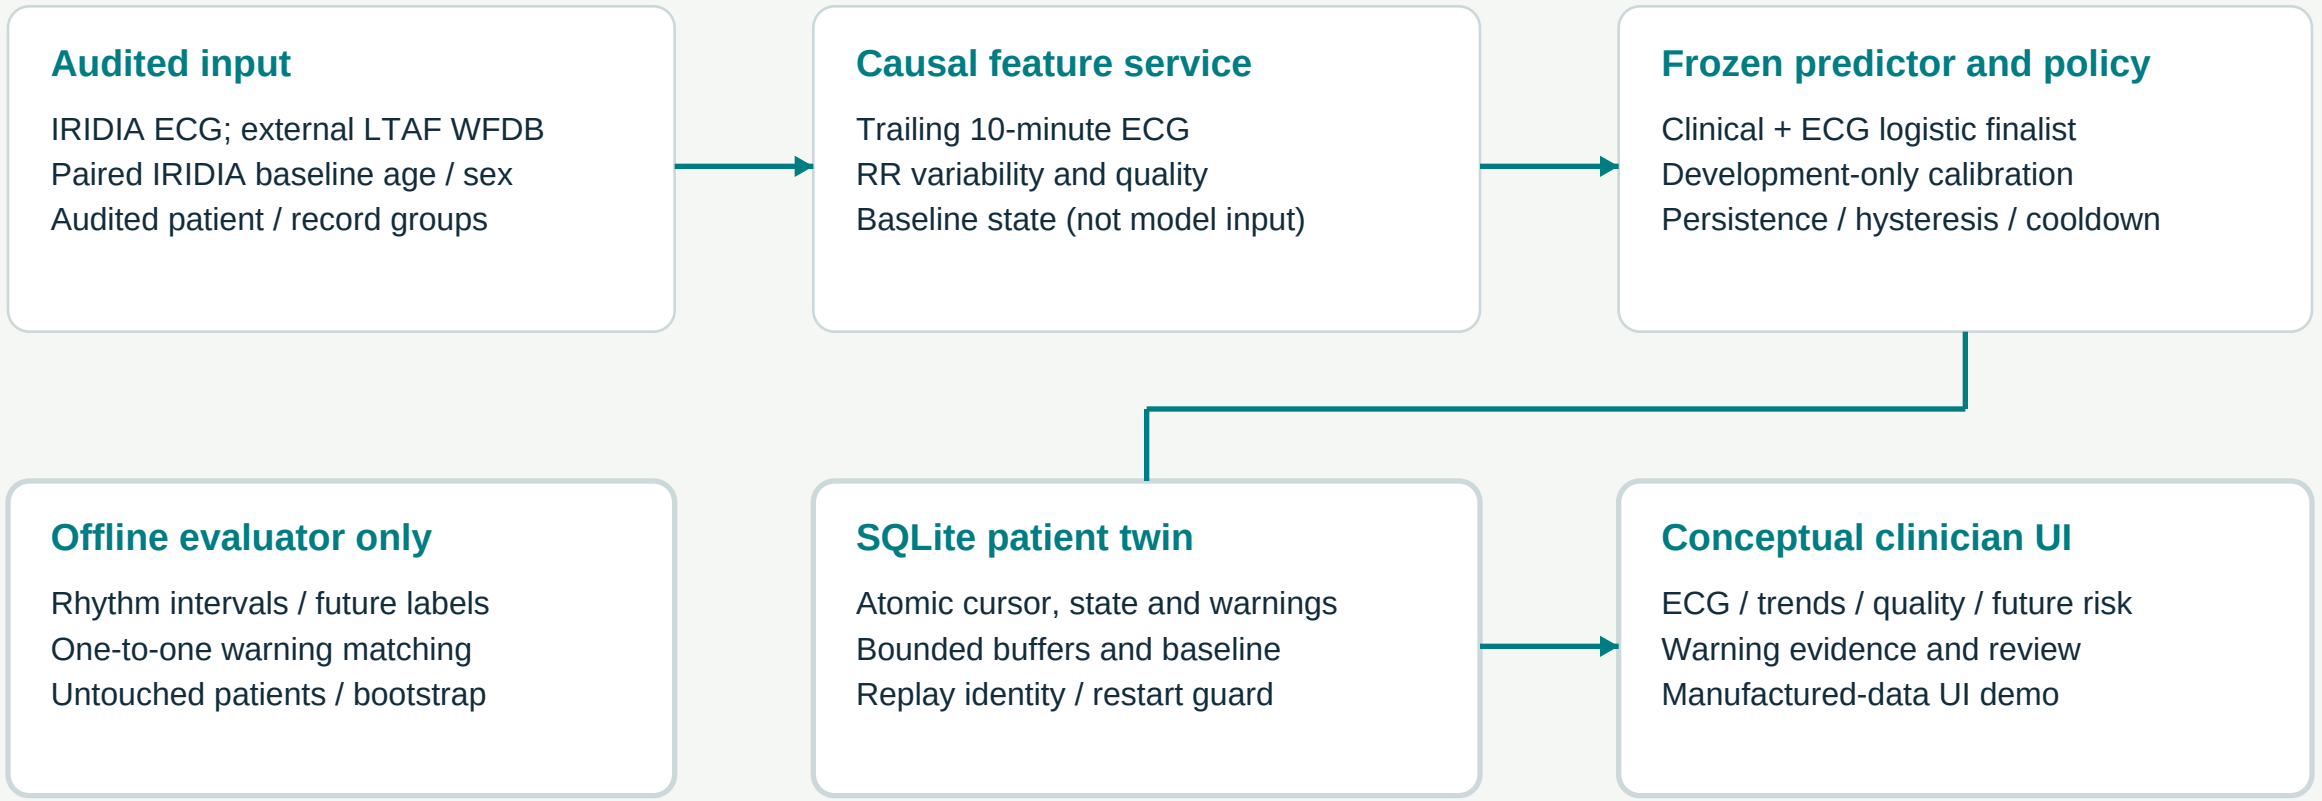
Clinical history plus causal ECG replay

Frozen model: offline research replay. Conceptual UI: manufactured-data demonstration.



Release and evaluation boundaries

Frozen research artifacts retain failed clinical acceptance gates.

Development only

121 IRIDIA development groups; independent fitting, calibration and policy groups. The challenge requires clinical + ECG fusion; the unrestricted ECG reference remains separate.

Freeze before opening test

Both declared finalists are frozen before primary/external evaluation. Preserve weights, calibration, schema, policy, split, seed and input identities; no held-out retuning.

Complete chronological evaluation

Report sensitivity and misses, false warnings, occupied time, calibration, coverage and latency. Primary intervals use patient groups; LTAF record groups do not prove independent people.

Local deployment

Localhost FastAPI/React with manufactured-data UI demo and SQLite. Default serving rejects failed-gate research models; actual fused replay is a trusted offline harness.
